

DAFA Facade Kit™ DAFA Butyl tapes

An alternative to joint sealant
We offer butyl products and solutions in all shapes and sizes for construction and industry which seal, absorb or protect.

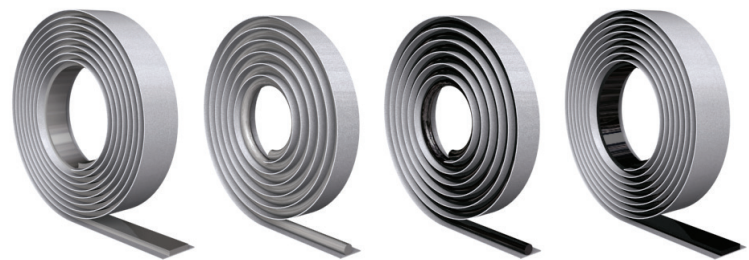

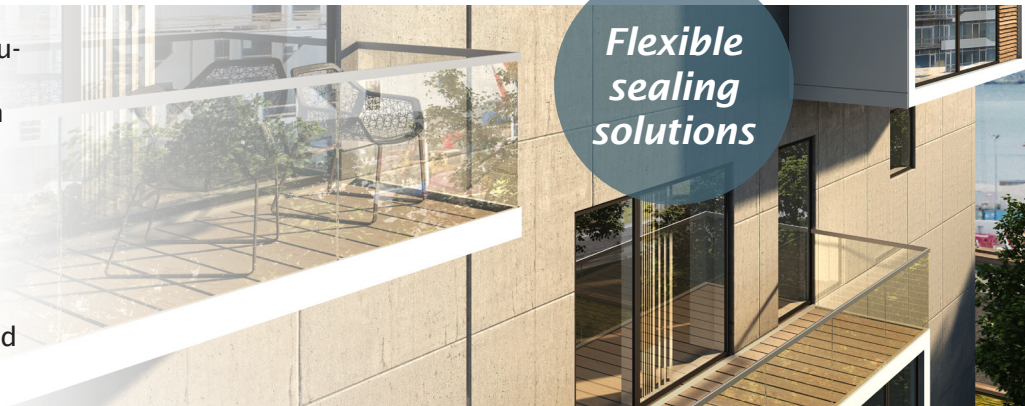

Butyl is a flexible sealing solution, as the material is made from soft and adhesive rubber. The material can absorb movements, bonds extremely well and is particularly durable.

Application

The butyl tape is typically used as an alternative to joint sealant, as butyl sealant does not spread out when compressed. The butyl tape is used to form a seal between panels that should not be separated again. The strip should be compressed by around 30%.

Benefits

- All types provide good adhesion to most surfaces.
- Good weather and UV resistant
- Other sizes and colours are available on request

Several variants of DAFA butyl tapes.
